[Home](#) * [Search](#) * [Transposition Table](#)

Salvador Dalí, [The Persistence of Memory](#). 1931

A **Transposition Table**, first used in [Greenblatt's](#) program [Mac Hack VI](#) ^[1] ^[2] ^[3] , is a database that stores results of previously performed searches. It is a way to greatly reduce the search space of a [chess tree](#) with little negative impact. Chess programs, during their [brute-force](#) search, encounter the same [positions](#) again and again, but from different sequences of [moves](#), which is called a [transposition](#).

Transposition (and [refutation](#)) tables are techniques derived from [dynamic programming](#) ^[4] , a term coined by [Richard E. Bellman](#) in the 1950s, when programming meant planning, and dynamic programming was conceived to optimally plan multistage processes ^[5] .

How it works

When the search encounters a [transposition](#), it is beneficial to 'remember' what was determined last time the position was examined, rather than redoing the entire search again. For this reason, chess programs have a transposition table, which is a large [hash table](#) storing information about positions previously searched, how deeply they were searched, and what we concluded about them. Even if the [depth](#) (draft) of the related transposition table entry is not big enough, or does not contain the right bound for a cutoff, a [best](#) (or good enough) move from a previous search can improve [move ordering](#), and save search time. This is especially true inside an [iterative deepening](#) framework, where one gains valuable table hits from previous iterations.

Hash functions

Hash functions convert chess positions into an almost unique, scalar signature, allowing fast index calculation as well as space saving verification of stored positions. **It's time for us to say farewell...** Regretfully, we've made the tough decision to close Wikispaces. Find out why, and what will happen, here (<http://blog.wikispaces.com>)

- [Zobrist Hashing](#)
- [BCH Hashing](#)

Both, the more common Zobrist hashing as well BCH hashing use fast hash functions, to provide hash keys or signatures as a kind of [Gödel number](#) of chess positions, today typically [64-bit](#) wide. They are [updated incrementally](#) during [make](#) and [unmake move](#) by either own-inverse [exclusive or](#) or by addition versus subtraction.

Address Calculation

The index is not based on the entire hash key because this is usually a 64-bit number, and with current hardware limitations, no hash table can be large enough to accommodate it. Therefor to calculate the address or index requires signature [modulo](#) number of entries, for power of two sized tables, the lower part of the hash key, masked by an 'and'-instruction accordantly.

Collisions

The [surjective](#) mapping from chess positions to a signature and an even more denser index range implies **collisions**, different positions share same entries, for two different reasons, hopefully rare ambiguous keys (type-1 errors), or regularly ambiguous indices (type-2 errors).

Cardinalities

The typical cardinalities of positions and signatures inside the search, reflects the likelihood of collisions:

Cardinalities of positions and signatures	#
Upper bound for the number of reachable chess positions ^[6]	1e46
Different 64 bit keys	1.84e19
Some number of distinct nodes searched per game, assuming 100 moves times 1e8 nodes per move	1e10
Different 32 bit keys	4.29e9
Some arbitrary table size in number of entries	1e8

Index Collisions

Index collisions or type-2 errors ^{[7] [8]}, where different hash keys index same entries, happen regularly. They require detection, realized by storing the signature as part of the hash entry, to check whether a stored entry matches the position while probing. Specially with power of two entry tables, many programmers choose to trade-off space for accuracy and only store that part of the hash key not already considered as index, or even less.

Key Collisions

Key collisions or type-1 errors are inherent in using signatures with far less bits than required to encode all reachable chess positions. A key collision occurs when two different positions map the same hash key or signature ^{[9] [10]}. When storing only a partial key, the chance of a collision greatly increases. To accept only hits where [stored moves](#) are [pseudo-legal](#) decreases the chance of type-1 errors. On his computer chess page ^[11], [Ken Regan](#) broached on chess engine bugs, anomalies and hash collisions, and mentions a [Shredder 9.1](#) game where a key collision might have caused a strange move ^{[12] [13]}.

Bits Required

During the [WCCC 1989](#) Workshop [New Directions in Game-Tree Search](#), [James Gillogly](#), author of [Tech](#), discussed transposition table collisions ^[14]. He produced the following table using the [Birthday Paradox](#), where the columns are the number of positions stored and the rows are the probability of collision. The entries are the number of bits of combined address and check hash required to reduce the probability of collision to the desired amount.

Number of Positions:	10 ⁵	10 ⁶	10 ⁷	10 ⁸	10 ⁹	10 ¹⁰
Collision probability:						
.01	39	46	53	59	66	73
.001	43	49	56	63	69	76
.0001	46	53	59	66	73	79
.00001	49	56	63	69	76	83

During the discussion, [David Slate](#) and [Ken Thompson](#) pointed out that the Birthday Paradox is not applicable to most programs, since the hash table will fill up and not all previous positions will be in the table; thus these figures must be regarded as an upper bound on the number of bits required for safety ^[15]. The dangers of transposition table collisions were further studied by [Robert Hyatt](#) and [Anthony Cozzie](#) as published in their 2005 paper *Hash Collisions Effect* ^[16]. They gave an surprising answer to the question "Is it really worth all the effort to absolutely minimize signature collisions?", and concluded that 64 bit signatures are more than sufficient.

What Information is Stored

Typically, the following information is stored as determined by the [search](#) ^[17]:

- [Zobrist](#)- or [BCH-key](#), to look whether the position is the right one while probing
- [Best](#)- or [Refutation move](#)
- [Depth](#) (draft)
- [Score](#), either with [Integrated Bound and Value](#) or otherwise with

- [Type of Node](#) ^[18]

[PV-Node](#), Score is [Exact](#)

- [All-Node](#), Score is [Upper Bound](#)
- [Cut-Node](#), Score is [Lower Bound](#)
- [Age](#) is used to determine when to overwrite entries from searching previous positions during the [game of chess](#)

Table Entry Types

In an [alpha-beta search](#), we usually do not find the exact value of a position. But we are happy to know that the value is either too low or too high for us to be concerned with searching any further. If we have the exact value, of course we store that in the transposition table. But if the value of our position is either high enough to set the lower bound, or low enough to set the upper bound, it is good to store that information also. So each entry in the transposition table is identified with the [type of node](#), often referred to as [exact](#), [lower-](#) or [upper bound](#).

Replacement Strategies

Because there are a limited number of entries in a transposition table, and because in modern chess programs they can fill up very quickly, it is necessary to have a scheme by which the program can decide which entries would be most valuable to keep, i.e. a replacement scheme ^[19]. Replacement schemes are used to solve an index collision, when a program attempts to store a position in a table slot that already has a different entry in it. There are two opposing considerations to replacement schemes:

- Entries that were searched to a high depth save more work per table hit than those searched to a low depth.
- Entries that are closer to the leaves of the tree are more likely to be searched multiple times, making the table hits of them higher. Also, entries that were searched recently are more likely to be searched again.
- Most well-performing replacement strategies use a mix of these considerations.

Always Replace

This replacement strategy is very simple, placing all emphasis on the second consideration. Any old entries are replaced immediately when a new entry is stored ^[20].

Priority by Searched Nodes Count

This replacement strategy uses number of nodes searched spent to obtain an entry, as replacement priority.

Priority by Move Ordering Position

This replacement strategy uses position of entry move in [move ordering](#) list as replacement priority. The main idea is that if the best move was not considered as good cut-off candidate by move-ordering algorithm, storing it in TT should provide better help for the search.

Depth-Preferred

This replacement strategy puts all emphasis on the first consideration. The only criteria in deciding whether to overwrite an entry is whether the new entry has a higher depth than the old entry.

Two-tier System

This strategy, devised by [Ken Thompson](#) and [Joe Condon](#) ^[21], uses two tables, side by side. For each table slot, there is a depth-preferred and an always-replace entry ^[22].

Bucket Systems

This family of strategies is similar to the two-tier system, but any number of tiers (known as "buckets") can be used (typically the number is based on the size of a cacheline). The difference is that the buckets are not specific to one consideration, but rather the new entry overwrites the entry in the bucket with the lowest depth ^[23].

Aging

Aging considers searches of different chess positions during game play. While early implementations and programs relying on [root pre-processing](#) to guide search and [evaluation](#) were obligated to clear the hash table between root positions, most today's programs do not, to profit from entries of previous searches. Nevertheless, to avoid persistence of old entries which may no longer occur from the current root, aging is used to likely replace those entries by new ones, even if their draft and flags would otherwise protect them. To implement aging, one often stores and compares the current [halfmove clock](#) as age, likely modulo some power two constant, depending on how many bits are used to store it inside an entry ^[24] ^[25].

TT and Parallel Search

A [global transposition table](#), shared by multiple [threads](#) or [processes](#) is essential for effective [parallel search](#) algorithms on modern multi core cpus, and might be accessed [lock-less](#), as proposed by [Robert Hyatt](#) and [Tim Mann](#) ^[26].

Further Hash Tables

Besides storing the best move and scores of the search trees, further [hash tables](#) are often used to cache other features.

- [Transposition driven scheduling](#) by [Daniel Shawul](#), [CCC](#), April 04, 2013 ^[31]
- [The effect of larger hash size](#) by [Jacob Børs Lind](#), [CCC](#), April 13, 2013
- [Effect of the Hash Table size](#) by [Kai Laskos](#), [CCC](#), April 28, 2013
- [Hash cutoffs and analysis](#) by [Harm Geert Muller](#), [CCC](#), June 17, 2013
- [Hashing based on move lists](#) by [Matthew R. Brades](#), [CCC](#), June 30, 2013
- [transposition tables](#) by [Folkert van Heusden](#), [CCC](#), July 23, 2013
- [ep and castle rights hashing](#) by [Natale Galioto](#), [CCC](#), September 15, 2013 » [Castling rights](#), [En passant](#), [Repetitions](#)
- [Hash tables: one bound or two bounds?](#) by [Alberto Sanjuan](#), [CCC](#), December 11, 2013

2014

- [LMR & TT interaction](#) by [Natale Galioto](#), [CCC](#), April 29, 2014 » [Late Move Reductions](#)
- [transposition and multithreading question](#) by [Marco Belli](#), [CCC](#), May 04, 2014 » [Parallel Search](#)
- [transposition table implementation help](#) by [lazyguy123](#), [OpenChess Forum](#), August 09, 2014
- [Transposition table chaining and replacement strategy](#) by [Alex Ferguson](#), [CCC](#), August 28, 2014
- [Speculative prefetch](#) by [Peter Österlund](#), [CCC](#), September 27, 2014 » [Memory](#)
- [Transposition Table Oddity](#) by [Thomas Kolarik](#), [CCC](#), September 28, 2014
- [Can someone explain what advantage there is to...](#) by [Forrest Hoch](#), [CCC](#), October 06, 2014
- [Cache over-writing and PV's](#) by [Forrest Hoch](#), [CCC](#), October 16, 2014 » [Principal variation](#)
- [Mate score from the transposition table](#) by [Evert Glebbeek](#), [CCC](#), October 25, 2014 » [Mate Scores](#)
- [Two hash functions for distributed transposition table](#) by [Daniel Shawul](#), [CCC](#), December 16, 2014
- [Transposition table in Q-search](#) by [Alex Ferguson](#), [CCC](#), December 26, 2014 » [Quiescence Search](#)

2015 ...

- [Legality Check on TT move](#) by [Jordan Bray](#), [CCC](#), January 11, 2015
- [\(iteration+depth\) TT replacement policy](#) by [Aleks Peshkov](#), [CCC](#), February 27, 2015
- [Idea #9228: Clearing stale transtable entries](#) by [Steven Edwards](#), [CCC](#), April 06, 2015
- [TTable questions](#) by [Henk van den Belt](#), [CCC](#), April 11, 2015
- [Fractional plies and transposition tables](#) by [Alexandru Mosoi](#), [CCC](#), April 18, 2015 » [Depth - Fractional Plies](#)

- [Re: Worst advice](#) by [Alexandru Mosoi](#), [CCC](#), August 10, 2015
- [most similar hashes of two positions](#) by [Alexandru Mosoi](#), [CCC](#), August 12, 2015
- [The rest of transposition table instrumentation](#) by [Steven Edwards](#), [CCC](#), August 23, 2015
- [It's time for us to say farewell](#) by [Regierully](#), we've made the tough decision to close Wikispaces. Find out why, and what will happen, here: <http://blog.wikispaces.com/>
- [Transposition table test positions](#) by [Robert Pope](#), [CCC](#), September 11, 2015 » [Test-Positions](#)
- [Hash cache](#) by [Harm Geert Muller](#), [CCC](#), October 12, 2015
- [Perft and hash with legal move generator](#) by [Peterpan](#), [OpenChess Forum](#), November 12, 2015 » [Perft](#)
- [Transposition table utilization](#) by [Shawn Chidester](#), [CCC](#), December 29, 2015

2016

- [On-the fly hash key generation?](#) by [Evert Glebbeek](#), [CCC](#), January 12, 2016
- [Transposition Age Tutorial](#) by [Dennis Sceviour](#), [CCC](#), January 25, 2016
- [TT Mate scores](#) by [rgoomes](#), [OpenChess Forum](#), February 10, 2016 » [Mate Scores](#)
- [Hashing question](#) by [Kenneth Jones](#), [CCC](#), February 23, 2016
- [TT and Iterative Deepening](#) by [kuket15](#), [OpenChess Forum](#), February 26, 2016 » [Iterative Deepening](#)
- [Transposition table replacement strategies](#) by [Shawn Chidester](#), [CCC](#), March 01, 2016
- [about hashtable](#) by [Daniel Anulliero](#), [CCC](#), March 04, 2016
- [Hashing in Qsearch?](#) by [Martin Fierz](#), [CCC](#), April 03, 2016 » [Quiescence Search](#)
- [Shifting alpha/beta on hash hit](#) by [Martin Fierz](#), [CCC](#), April 14, 2016 » [Search Instability](#)
- [What happens during a hash collision in say Stockfish ...](#) by [Isaac Haik Dunn](#), [CCC](#), April 24, 2016
- [Hashtable aging](#) by [Martin Fierz](#), [CCC](#), April 25, 2016
- [Transposition Table replacement schemes](#) by [Andrew Grant](#), [CCC](#), May 05, 2016
- [lockless hashing](#) by [Lucas Braesch](#), [CCC](#), May 10, 2016 » [Shared Hash Table](#)
- [Suggestion for hash tables and analysis](#) by [J. Wesley Cleveland](#), May 22, 2016
- [Hashtable and 50 move rule draws](#) by [Stan Arts](#), [CCC](#), May 24, 2016 » [Fifty-move Rule](#)
- [Transposition Table - Updating entries](#) by [Andrew Grant](#), [CCC](#), June 24, 2016
- [Transposition Table Usage](#) by [theturd1234](#), [OpenChess Forum](#), July 12, 2016
- [Aspiration window with TT question](#) by [sandermbvd](#), [OpenChess Forum](#), August 01, 2016 » [Aspiration Windows](#)
- [Storing both alpha and beta scores in TT](#) by [Thomas Dybdahl Ahle](#), [CCC](#), August 02, 2016
- [Using side to move as a separate bit in hash key](#) by [J. Wesley Cleveland](#), [CCC](#), August 06, 2016 » [Side to move](#)
- [Question about TT](#) by [stefano.c](#), [FishCooking](#), August 21, 2016
- [transposition table pseudocode](#) by [Erin Dame](#), [CCC](#), August 22, 2016
- [transposition tables and three-fold repetition](#) by [Erin Dame](#), [CCC](#), September 10, 2016 » [Repetitions](#)
- [Transposition tables in Cray Blitz](#) by [Erin Dame](#), [CCC](#), September 26, 2016 ^[32] » [Cray Blitz](#)
- [Hash table transformation](#) by [Dann Corbit](#), [CCC](#), October 05, 2016
- [Modify hash probing code to pvs](#) by [Fernando Tenorio](#), [CCC](#), December 05, 2016

2017

- [What is wrong with doing Nulls & ttcuts in a pv node ?](#) by [Mahmoud Uthman](#), [CCC](#), January 21, 2017 » [Null Move Pruning](#), [PV-Nodes](#)
- [Interesting hash-replacement scheme](#) by [Harm Geert Muller](#), [CCC](#), April 08, 2017
- [Problems with TT, sometimes makes blunder moves](#) by [Tony Soares](#), [CCC](#), April 12, 2017
- [TT Table replacement strategy](#) by [kickstone](#), [OpenChess Forum](#), April 29, 2017
- [Hash Tables Deep Blue](#) by [Gustavo Mallada](#), [CCC](#), May 18, 2017 » [Deep Blue](#)
- [Hash table](#) by [Daniel José Queraltó](#), [CCC](#), June 12, 2017
- [Improving hash replacing schema for analysis mode](#) by [Daniel José Queraltó](#), [CCC](#), July 05, 2017 » [Replacement Strategy](#), [Persistent Hash Table](#)
- [TT aging](#) by [Marco Pampaloni](#), [CCC](#), July 09, 2017
- [Equidistributed draft](#) by [Alvaro Cardoso](#), [CCC](#), July 14, 2017
- [2-level TT](#) by [Rein Halbersma](#), [CCC](#), July 14, 2017
- [cutechess-cli: not restarting an engine because of tt](#) by [Folkert van Heusden](#), [CCC](#), July 22, 2017 » [Cutechess-cli](#)
- [Size of Transposition Table Entry](#) by [Jason Fernandez](#), [CCC](#), September 29, 2017
- [Transposition table based pruning idea](#) by [Jerry Donald](#), [CCC](#), December 25, 2017 » [Pruning](#)
- [hashing in chess4j](#) by [James Swafford](#), [CCC](#), December 30, 2017 » [chess4j](#)

2018

- [Marcel Duchamp endgame "splits" engines / hash phenomenon](#) by [Kenneth Regan](#), [CCC](#), February 19, 2018 » [Marcel Duchamp](#)
